

Our experience clearly shows that it is all about the data, but data is not a sexy word. It cannot be hyped by slick salespeople in shiny suits.

We do not like hypes; they only distract you from what is important. We care about our customers, and the security of the data they possess and/or process. Both IP and all kinds of personal data; so should you!

We founded UNICORN Security in 2017 because it was time again for a back to basics, no-nonsense IT security services provider, to help organisations to focus once more on the actual important issues.

DATA PROTECTION

We are strong advocates of the universal right to privacy, the protection of (personal) data, and intellectual property. Over the last decades we dedicated ourselves to make the world a little safer and more secure. It is important to balance risks, costs, and usability. We help you to make these balanced decisions.

UNICORN SECURITY

UNICORN Security is an agile and flexible organisation that helps you to take care of all major aspects in the realm of Cybersecurity.

We strongly believe that our passion to keep data safe and secure will enable you to do your business in a better and more satisfying way, but it never is, or will be, an easy task.

WHY (Vision): Because we care about the universal right to privacy and keeping (sensitive) data safe.

WHAT (Mission): We support organisations with various IT security processes.

HOW (Approach): We create partnerships with our customers to ensure they keep control on information security.

UNICORN SECURITY CAN ALSO BE YOUR INDEPENDENT ICT SECURITY PARTNER

The services we provide cover all major aspects of IT security you need to identify, mitigate or eliminate the business security risks you face on a daily basis. It is important to balance risks, costs, and usability. We help you to make these balanced decisions.

Security Awareness

Technology can only help you to limit the effects of human error or criminal manipulation. Your employees are working with your valuable data on a daily basis. Keep that data safe by creating better security awareness in your organisation.

Penetration testing

Besides standard off the shelf hardware and software you use custom built applications on a daily basis. We try to identify logic flaws and configuration errors using provided information or information we gather during reconnaissance.

Consultancy

These days customers ask proof that you are in control regarding the security of your IT environment. Our consultants have a vast experience with certifications, and are able to support your organisation in achieving and preserve these certifications.

Vulnerability scanning, analysis & reporting

We provide a complete package, that not only informs you of identified vulnerabilities, but also keeps track over time and takes into account any mitigating measures you have installed.

Technical security training

In today's world your customers expect you to keep their data safe. We train developers and administrators to build secure software and infrastructures. Our training curriculum include standard hands-on courses, but these can be tailored to your specific needs.

Please visit our website, or better still contact us for additional information on the services we provide or to discuss your specific requirements further.
